The study of comparative anatomy predates the modern study of evolution. Early evolutionary scientists like Buffon and Lamarck used comparative anatomy to determine relationships between species. Organisms with similar structures, they argued, must have acquired these traits from a common ancestor ...

In fish the islets are big and prominent and consist of three kinds of cells (Fig. 19.12a, b): (i) The beta cells which secrete insulin and take aldehyde fuschin stain, (ii) Another type of cells are alpha cells, which do not take aldehyde fuschin stain and have two types, A 1 and A 2 cells, which produce glucagon.

**Comparative
Anatomy - Evidence
for Evolution**

Comparative anatomy
is a study of the

Access Free Comparative Anatomy Of Fish And Amphibia For B.Sc

differences and similarities in the anatomy of two species. In general, it includes a comparison of body structures of two species. It is similar to phylogeny and evolutionary biology. Evolution is nothing but a genetic change that occurs in a population over time.
