### Design of Structural Connections

Connections are an essential part of any structure, and in timber structures they are often the most critical part of a design. The timber section size is often determined by the strength of the section remaining after drilling holes for bolts or dowels, or by the spacing requirements for the fasteners, rather than the load-carrying capacity of the timber.

similar structural behaviour. This means in particular the application of limit state design methods which allow a better description of the real, non linear behaviour of a structure than allowable stress methods are capable of. However, the use of limit state design methods requires knowledge of the structural behaviour of members and connections.

There is a discrepancy between the actual behavior and the analysis of steel structure is large, therefore the connections are complex to analyze and design. When the structural member fails in case of overloading then there is a general practice to prefer the individual member rather than the connections, therefore this kind of practice affects many structural members.
