Bronfenbrenner's Bioecological Model of Development ...

An ecosystem model is an abstract, usually mathematical, representation of an ecological system (ranging in scale from an individual population, to an ecological community, or even an entire biome), which is studied to better understand the real system. Using data gathered from the field, ecological relationships—such as the relation of sunlight and water availability to photosynthetic rate, or that between predator and prey populations—are derived, and these are combined to form ...

In the Monod or Michaelis-Menten-type growth functions used in many ecological models, empirically determined half-saturation constants are required to determine the shape of the curve. In this model, the growth rate of autotrophs is determined from a functional form specifying the interaction of the maximum supply rates of nutrients and light, and the maximum growth rate.
