What causes joint hypermobility syndrome. Joint hypermobility syndrome usually runs in families and can't be prevented. Usually, the joints are loose and stretchy because the tissues that should make them stronger and support them are weak. The weakness is because the collagen that strengthens the tissues is different from other people's.

Joint Hypermobility Handbook - Left Paw Press

The term generalized joint hypermobility (GJH) is used when a person has several joints that are more flexible than usual. This happens when the connective tissue which makes up the joint structures (capsule and ligaments) is more compliant (more easily stretched) than usual. Many children with hypermobile joints have movement difficulties.

Joint Hypermobility and Joint Hypermobility Syndrome

Joint hypermobility is also a feature of a rare, inherited, more significant medical condition called Ehlers-Danlos syndrome (EDS), which is characterized by weakness of the connective tissues of the body. Joint hypermobility is commonly seen in people with Down syndrome and in people with Marfan syndrome.
