Jim Berryman - Papers on Rock Physics

In a standard seismic interpretation workflow rock physics is used to relate impedance and elastic parameters derived from seismic data to specific rock properties. This constrains what seismic data is physically capable of resolving and the non-uniqueness associated with a specific interpretation.

Using rock physics we can create a model for each subsurface lithofacies, describing its petrophysical and elastic behaviour through a set of empirical, heuristic and theoretical relations. Calibration of rock physics relationships is based on local well logs, often complemented with regional or global data where local calibration is missing.
